

Section 8

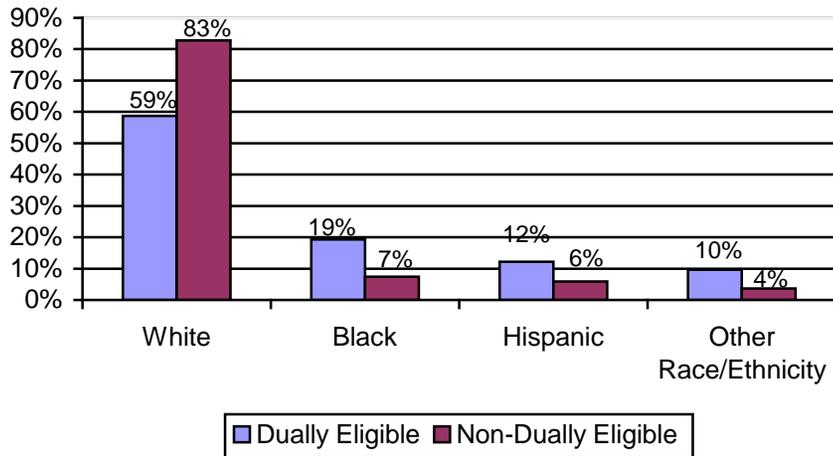

Medicare Dually Eligible Population in 2005

- There were over 7.4 million Medicare beneficiaries enrolled in Medicaid in 2005. (Medicaid is the program designed to provide low-income persons with health care.) The dually eligible made up 15 percent of the Medicare population.
- This population was more likely to be a minority female, in poorer health or disabled, and to be less educated than the average Medicare beneficiary. All of these characteristics tended to be correlated with lower incomes.
- The dually eligible beneficiary was also less likely to be married and more likely to live in a long-term health care facility.
- The dually eligible population was 63 percent female and 37 percent male, while the non-dually eligible population was more evenly split at 55 percent female and 45 percent male.
- Thirty-nine percent of the dually eligible were under age 65 and qualified for Medicare benefits due to a disability. The disabled population made up only 11 percent of the non-dually eligible beneficiaries.
- The dually eligible population was also disproportionately young. Thirty-nine percent of the dually eligible were aged 64 or younger versus 11 percent of the non-dually eligible population.

Dually and Non-Dually Eligible Beneficiaries, by Age

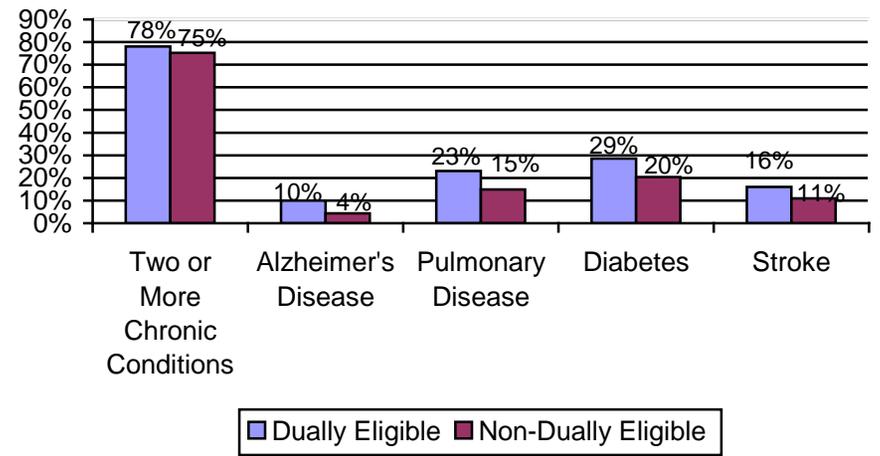

Dually Eligible and Non-Dually Eligible, by Race and Ethnicity

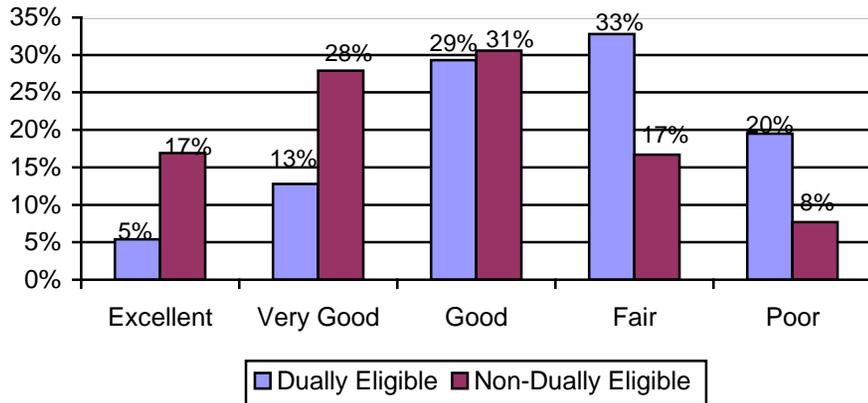

- Minorities, which comprised only 17 percent of the non-dually eligible population, made up 41 percent of the dually eligible population. Nineteen percent of the dually eligible beneficiaries were Black, 12 percent were Hispanic, and 59 percent were White.

Dually Eligible and Non-Dually Eligible, by Diseases/Conditions

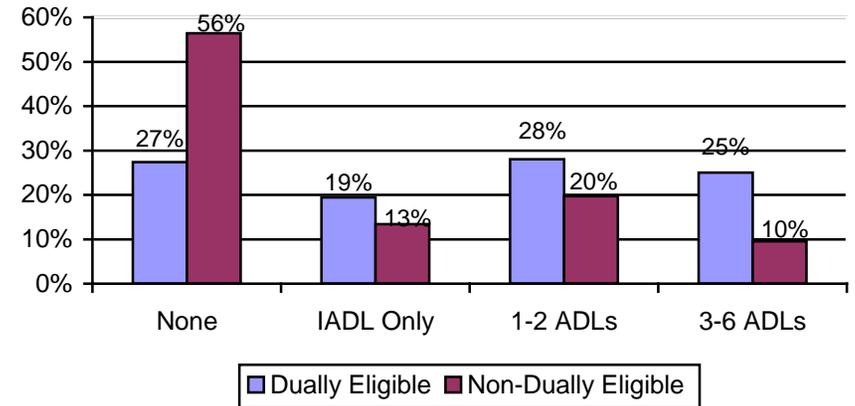

- The dually eligible population was more likely to have two or more chronic conditions or diseases such as diabetes or Alzheimer's disease.

Dually Eligible and Non-Dually Eligible, by Health Status

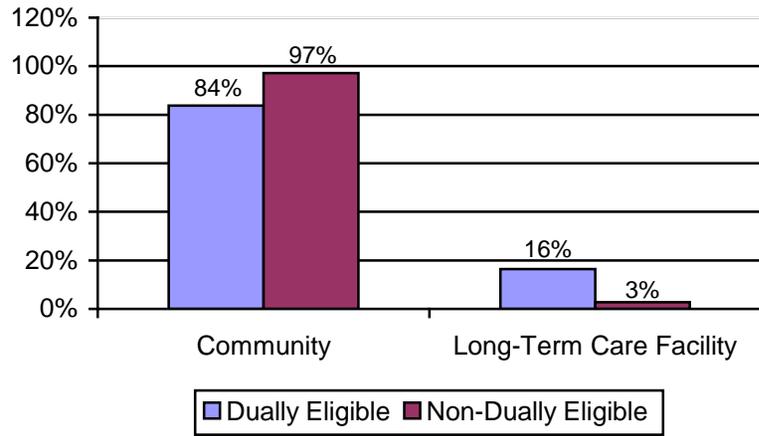

Dually Eligible and Non-Dually Eligible, by Functional Limitation

- The dually eligible population was in poorer health than the non-dually eligible. Over half of the dually eligible population reported that they were in poor or fair health.
- Only 18 percent of the dually eligible population reported their health as excellent or very good, while 45 percent of the non-dually eligible population reported their health as excellent or very good.

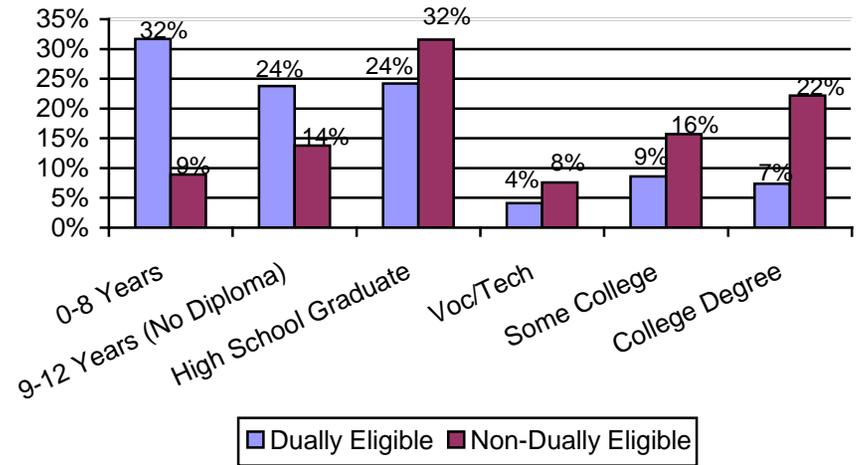

- In addition to being in poorer health, the dually eligible population was much more likely to have functional limitations. Almost three-quarters of the dually eligible population had some type of functional limitation, and 53 percent of dually eligible beneficiaries could not perform one or more of the activities of daily living.

Dually Eligible and Non-Dually Eligible, by Residential Status

- Sixteen percent of dually eligible beneficiaries lived in long-term care facilities versus only 3 percent of non-dually eligible beneficiaries. Over half (56%) of the non-dually eligible population lived with their spouse compared to 17 percent of dually eligible population.

Dually Eligible and Non-Dually Eligible, by Years of Schooling

- Fifty-six percent of the dually eligible population did not graduate from high school and only 9 percent had at least some college education. By contrast, 77 percent of the non-dually eligible population graduated from high school.
